

AI in BlockChain ClassNotes

Solved cases

1. Immutable logging / provenance for AI data and outputs
2. Oracles connecting AI decisions to smart contracts
3. Tokenized marketplaces for compute / inference / model services
4. Payments, incentives, and access control for AI services

Partially solved / not fully solved cases

1. Verifiable AI inference
2. Privacy-preserving AI on blockchain
3. Full lifecycle auditability of AI systems
4. Decentralized autonomous AI agents on-chain
5. AI for smart contract generation and auditing.

Problems created with AI in blockchain

1. AI-generated smart contract bugs
2. Smarter scams and phishing
3. Automated market manipulation
4. Deepfake identity and KYC fraud
5. Sybil attacks at larger scale
